

## Positive Quality Intervention: Cabazitaxel (Jevtana®) for Patients with Metastatic Castration-Resistant Prostate Cancer

**Description:** Cabazitaxel is indicated for treatment of patients with metastatic castration-resistant prostate cancer (mCRPC) previously treated with a docetaxel-containing treatment regimen in combination with prednisone.<sup>1</sup> The purpose of this PQI is to provide guidance for initiating cabazitaxel.

**Background:** Cabazitaxel was FDA approved in 2010 based on the phase 3 trial TROPIC that compared cabazitaxel plus prednisone to mitoxantrone in patients with mCRPC previously treated with a docetaxel-based treatment.<sup>1</sup> The recommended dose of cabazitaxel is 20 mg/m<sup>2</sup> every 3 weeks. The higher dose of 25 mg/m<sup>2</sup> can be used at provider discretion for select patients.<sup>2,3</sup> The CARD trial evaluated the use of cabazitaxel with prednisone/prednisolone and G-CSF for patients with mCRPC previously treated with docetaxel and an androgen signaling targeted inhibitor (abiraterone or enzalutamide) who had progressed within 12 months. The study compared cabazitaxel to initiation of another androgen-signaling-targeted inhibitor not previously used. The median radiographic progression-free survival was 8 months with cabazitaxel treatment group and 3.7 months with androgen receptor inhibitor group (HR 0.54, p<0.0001). When comparing median overall survival, cabazitaxel had a longer overall survival compared to androgen-signaling-targeted inhibitor, 13.6 months vs 11 months. Overall, cabazitaxel was associated with a 36% risk of death reduction. Secondary objectives include improvement in progression free survival, pain response, and time to symptomatic skeletal events favored cabazitaxel.<sup>2,4</sup>

## **PQI Process:**<sup>2</sup>

- Review the medical record
  - o Review past treatments for documentation of previous docetaxel administration
    - If docetaxel was not previously given, evaluate the reason for non-use, per guidelines, patients who are not candidates for docetaxel can still be considered for cabazitaxel (ex. pre-existing mild neuropathy prevented docetaxel use)
  - Review labs for recent CBC
    - Cabazitaxel is contraindicated in patients with neutrophil counts  $\leq 1,500$  cells/mm<sup>3</sup>
- Review treatment plan
  - Verify premedication orders
    - Antihistamine: diphenhydramine 25 mg or equivalent antihistamine
    - Corticosteroid: dexamethasone 8 mg or equivalent steroid
    - H2 antagonist: famotidine 20 mg or equivalent H2 antagonist
  - Verify cabazitaxel dosing
    - 20 mg/m<sup>2</sup> administered every three weeks as a one-hour intravenous infusion
    - Dose adjustments needed for hepatic impairment; no adjustment for renal impairment
  - If provider is starting dosing as 25 mg/m<sup>2</sup>, strongly consider G-CSF and <u>CINV</u> prophylaxis
    - Incidence of Grade 3/4 nausea at this dose was 2% and grade 3-4 vomiting was 2%<sup>1</sup>
    - Verify prescription or order for antiemetic; prophylaxis recommended (PO or IV)
    - Recommended for patient with high-risk clinical features such as previous episodes of febrile neutropenia, older patients, extensive prior radiation, poor performance or nutritional status, or other serious comorbidities
  - Verify prescription for prednisone has been entered
- Monitoring
  - CBC: baseline, weekly during cycle one, then before each treatment cycle

**IMPORTANT NOTICE:** NCODA has developed this Positive Quality Intervention platform. This platform is intended as an educational aid, does not provide individual medical advice, and does not substitute for the advice of a qualified healthcare professional. This platform does not cover all existing information related to the possible uses, directions, doses, precautions, warning, interactions, adverse effects, or risks associated with the medication. The materials contained in this platform do not constitute or imply endorsement, recommendation, or favoring of this medication by NCODA. NCODA does not ensure the accuracy of the information presented and assumes no liability relating to its accuracy. All decisions related to taking this medication should be made with the guidance and under the direction of a qualified healthcare professional. It is the individual's sole responsibility to seek guidance from a qualified healthcare professional. *Updated 3.22.24* 

- Preparation
  - o Cabazitaxel requires two dilutions for preparation
  - Mix cabazitaxel vial with the entire contents of the included diluent vial; mixed concentration 10 mg/mL
    - Inject slowly to reduce foaming; gently mix by repeated inversion for at least 45 sec
  - Withdraw the patient specific dose of cabazitaxel and inject into a 250 mL PVC-free container of 0.9% sodium chloride (NS) or 5% dextrose (D5W)
    - If dose is >65 mg use a larger volume solution so the concentration is  $\leq 0.26$  mg/mL
  - $\circ$  Mix the final infusion solution by gently inverting the bag
- Administration
  - IV over one hour with a 0.22-mcm nominal pore size inline filter

## **Patient-Centered Activities:**

- Patient Education: Provide Intravenous Cancer Treatment Education (IVE) Sheet
  - Review the risk of infusion reactions, which will most likely to occur during first or second infusion
    - Signs of a reaction may include rash/itching, dizziness, chest or throat tightness, difficulty breathing, face swelling
  - Instruct patient to report any adverse events, such as fever, diarrhea, nausea/vomiting, numbness/tingling of the hands or feet, or fatigue
  - Ensure patient has access to supportive medications
    - Anti-nausea (ex. 5-HT3 receptor antagonist, metoclopramide, or prochlorperazine)
    - Anti-diarrheal (ex. loperamide)
  - Provide written information to patient on medication
- Patient Assistance: NCODA Financial Assistance Tool
